

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	03 October 2026
Team ID	SWTID-2026-8726
Project Name	Auto Ticket Classification using FLOW DESIGNER
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a collaborative environment for the team to identify and generate possible solutions for improving the traditional manual ticket classification process. The team focuses on generating multiple ideas related to automatic ticket analysis, classification, prioritization and assignment using Flow Designer.

The ideas are generated without initially judging their feasibility, allowing the team to explore different approaches such as keyword-based classification, conditional routing, priority assignment, automated notifications, fallback handling and intelligent ticket processing.

The generated ideas are then grouped according to their purpose and prioritized based on their importance and feasibility for implementing the Auto Ticket Classification system.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Team Gathering & Collaboration

The team members collaboratively analyzed the existing service desk ticket-handling process and identified the major problems associated with manual ticket triage.

Problem Statement Selected

“Manual ticket classification and routing causes delays, routing errors, inconsistent priority assignment and increased workload for support teams. Therefore, an automated Flow Designer-based system is required to classify incoming tickets, assign appropriate categories, determine priority and route tickets to the correct support group automatically.”

The project objectives include automating initial triage, reducing routing delays, standardizing SLA priority enforcement, providing maintainable Flow Designer logic and maintaining audit trails.

Key Problems Identified

1. Manual ticket classification takes significant time.
2. Tickets may be routed to incorrect support groups.
3. Priority assignment can be inconsistent.
4. Critical tickets may experience delays.

5. Increasing ticket volume creates scalability problems.
 6. Repeated manual triage increases support-team workload.
-

Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Ideas

Idea	Description
1. Keyword-Based Classification	Identify keywords such as “VPN”, “Network”, “Wi-Fi”, “Password”, “Login”, “Server down” and classify tickets automatically.
2. Automatic Category Assignment	Automatically assign the appropriate ticket category based on the detected content.
3. Automatic Assignment Group Routing	Route classified tickets directly to groups such as NOC, Helpdesk, Systems Engineering or HR Operations.
4. Automatic Priority Assignment	Determine P1–P4 priority according to ticket conditions and keywords.
5. User Department Lookup	Retrieve the user's department/profile information to support classification and priority decisions.
6. Conditional Flow Branching	Use If-Else/Switch logic in Flow Designer to process different ticket types.
7. General Support Catch-All Queue	Route unmatched or ambiguous tickets to a General Support Triage Queue instead of dropping them.
8. Classification Anomaly Notification	Notify supervisors when a ticket cannot be classified automatically.
9. Error Logging & Exception Handling	Capture workflow and database errors without stopping the complete automation process.
10. Audit Trail	Record classification decisions, transformations and assignment actions for tracking and reporting.
11. Machine Learning Integration	Use historical ticket data to improve semantic classification beyond fixed keywords.
12. Sentiment Analysis	Analyze customer tone and identify tickets that may require priority escalation.

Idea	Description
13. Multi-Language Classification	Support tickets submitted in different regional and international languages.
14. Dynamic Load Balancing	Consider support-agent availability and workload while assigning tickets.

The first ten ideas align with the documented current architecture and exception-handling design, while the final four are identified in the project's future-enhancement roadmap.

Idea Grouping

Group 1 – Ticket Analysis

- Keyword-Based Classification
- User Department Lookup
- Multi-Language Classification
- Sentiment Analysis

Group 2 – Classification & Prioritization

- Automatic Category Assignment
- Automatic Priority Assignment
- Conditional Flow Branching
- Machine Learning Integration

Group 3 – Ticket Routing

- Automatic Assignment Group Routing
- Dynamic Load Balancing
- General Support Catch-All Queue

Group 4 – Reliability & Monitoring

- Classification Anomaly Notification
- Error Logging & Exception Handling
- Audit Trail

Step-3: Idea Prioritization

For prioritization, the ideas are evaluated using the same two dimensions shown in the sample:

- Importance – How important the idea is to solving the project's core problem.

- Feasibility – How practically the idea can be implemented using the current Flow Designer architecture.

Priority Matrix

Idea	Importance	Feasibility	Priority Position
Keyword-Based Classification	High	High	High Priority
Automatic Category Assignment	High	High	High Priority
Automatic Assignment Group Routing	High	High	High Priority
Automatic Priority Assignment	High	High	High Priority
Conditional Flow Branching	High	High	High Priority
User Department Lookup	Medium	High	Medium–High
General Support Catch-All Queue	High	High	High Priority
Error Logging & Exception Handling	High	High	High Priority
Classification Anomaly Notification	Medium	High	Medium–High
Audit Trail	Medium	High	Medium–High
Machine Learning Integration	High	Medium	Future Priority
Sentiment Analysis	Medium	Medium	Future Priority
Multi-Language Classification	Medium	Medium	Future Priority
Dynamic Load Balancing	Medium	Medium	Future Priority

Selected Core Ideas

Based on the project documentation, the core implementation should focus on:

Ticket Created → Content Evaluation → Keyword/Condition Detection → Category Assignment → Priority Assignment → Support Group Routing → Fallback/Logging

This directly matches the project's documented Flow Designer architecture, where incoming tickets are triggered, their content/profile is evaluated, and conditional branches determine category, assigned group and priority.

Final Prioritized Concept

“Develop an automated Flow Designer workflow that analyzes newly created tickets, identifies relevant keywords and conditions, automatically assigns category and priority, routes the ticket to the appropriate support group, and uses fallback and exception-handling mechanisms for unclassified or problematic tickets.”

This is the strongest ideation-to-implementation bridge for your project because it covers the main objective documented in the report: replacing manual triage with automated classification and routing.
