

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	03 October 2026
Team ID	SWTID-2026-8726
Project Name	Auto Ticket Classification using FLOW DESIGNER
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed **Auto Ticket Classification using FLOW DESIGNER** solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Ticket Creation & Trigger	Create a new Incident / Service Request
		Automatically trigger Flow Designer when a ticket is created
		Verify that Assignment Group is empty before processing
FR-2	Ticket Content Evaluation	Analyze Short Description and Description
		Extract relevant keywords and error terms
		Evaluate Caller / Requester Profile
		Identify ticket Channel Source
FR-3	Automatic Ticket Classification	Identify ticket category using predefined keywords
		Apply conditional If-Else / Switch logic
		Classify Network, Identity & Access, Infrastructure, HR and other ticket types
FR-4	Priority Assignment	Determine ticket priority based on configured conditions
		Assign P1/P2/P3/P4 priority levels
		Apply higher priority to critical incidents such as server outage
FR-5	Automatic Ticket Routing	Identify appropriate Assignment Group
		Route Network issues to Network Operations Center
		Route access issues to Helpdesk Tier-1
		Route infrastructure issues to Systems Engineering
		Route HR issues to HR Operations & Payroll
FR-6	Fallback & Exception Handling	Route unmatched tickets to General Support Triage Queue
		Notify supervisors about classification anomalies
		Capture workflow and database errors in system logs
FR-7	Audit & Monitoring	Record classification decisions

		Record assignment actions and data transformations
		Maintain audit and system logs
FR-8	Rule Maintenance	Allow administrators to maintain classification rules
		Update keyword dictionaries and routing conditions
		Modify Flow Designer branches without rebuilding the complete system

These requirements follow the documented project architecture: ticket creation triggers the flow, ticket content and requester information are evaluated, conditional branches determine category/priority/assignment, and fallback mechanisms handle unmatched tickets.

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Flow Designer should provide a clear visual workflow that administrators can understand and maintain easily.
NFR-2	Security	Ticket, requester and classification information should be processed through appropriate access-controlled service management workflows.
NFR-3	Reliability	The system should continue processing tickets even when individual classification or database errors occur, using fallback and error-handling mechanisms.
NFR-4	Performance	Ticket classification and routing should occur rapidly after ticket creation, reducing manual triage delays.
NFR-5	Availability	The automated classification workflow should remain available for incoming service tickets and avoid dropped records through fallback processing.
NFR-6	Scalability	The solution should support increasing ticket volumes without requiring proportional increases in manual triage personnel.
