

Project Executable Files

Date	03 October 2026
Team ID	SWTID-2026-8726
Project Name	Auto Ticket Classification using FLOW DESIGNER
Maximum Marks	3 Marks

Project Executable Files

This section provides the executable, deployable and configuration items required to evaluate the Auto Ticket Classification using FLOW DESIGNER solution. The project is implemented within the ServiceNow platform; therefore, platform configuration and workflow artifacts are used instead of a conventional local source-code package.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	NA – ServiceNow Flow Designer configuration
2	README / Setup Guide (instructions to run the project)	Yes – included in project documentation
3	requirements.txt / package.json / dependency file	NA – no local package dependency
4	Database schema / seed files (if applicable)	NA – ServiceNow records/configuration
5	Environment configuration file (.env.example or similar)	NA – ServiceNow environment configuration
6	Deployed application URL (if hosted)	To be provided by project team
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes – Functional, Performance and UAT test documents
10	Demo video or walkthrough (if required)	To be provided by project team

Step 2: File / Folder Structure

The project is maintained as a ServiceNow configuration rather than a conventional local source-code folder.

/Auto-Ticket-Classification

/Flow-Designer

- Record Created Trigger
- Content Evaluation & Parsing
- Decision Matrix / Conditional Branching
- Category / Priority / Assignment Actions
- Fallback Handling

/Configuration

- Classification Keywords / Conditions
- Assignment Groups

/Testing

- Functional & Performance Test Results
- UAT Test Cases / Report

/Documentation

- Project Report
- Setup / Run Instructions

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	To be provided by project team / ServiceNow instance URL
Login Credentials (Demo)	Authorized ServiceNow evaluator credentials – to be provided securely
Platform / Hosting Provider	ServiceNow Platform
Repository Link	Not provided / Not applicable to current ServiceNow configuration
Demo Video Link	To be provided by project team

Step 4: Run Instructions

Pre-requisites:

- Access to the configured ServiceNow instance.
- Appropriate permissions for Flow Designer and Incident / Service Request records.
- Configured assignment groups and classification conditions.

Step 1: Sign in to the configured ServiceNow environment.

Step 2: Open the Incident / Service Request interface.

Step 3: Create a new ticket with the required description and requester information.

Step 4: Save/submit the ticket to satisfy the Record Created trigger.

Step 5: Allow the Flow Designer workflow to execute.

Step 6: Verify the automatically assigned category, priority and assignment group.

Step 7: For an unmatched ticket, verify routing to the General Support Triage Queue.

Step 8: Review workflow execution and audit/log information where applicable.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Unmatched or ambiguous tickets may not satisfy a specific classification rule.	Route to General Support Triage Queue for manual review.
2	Rule-based classification depends on configured keywords and conditions.	Maintain and update classification rules when requirements change.
3	No standalone executable binary or local dependency package is provided.	Run and evaluate the solution inside the configured ServiceNow environment.

Submission Note: The supplied template requests executable/deployable artifacts. For this ServiceNow Flow Designer project, the deployable artifact is the configured workflow and related ServiceNow configuration rather than a standalone executable.
