

Scalability & Future Plan

Date	03 October 2026
Team ID	SWTID-2026-8726
Project Name	Auto Ticket Classification using FLOW DESIGNER
Maximum Marks	1 Mark

Scalability & Future Plan:

This document outlines how the current Auto Ticket Classification using FLOW DESIGNER solution can be scaled to handle larger ticket volumes, increased workflow activity and extended automation features in the future. It also provides a roadmap for enhancing the current rule-based ServiceNow workflow beyond its present implementation.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address (High / Medium / Low)
1	Rule-based classification depends on configured keywords and conditions.	New or differently worded tickets may not match an existing classification rule and can require manual review.	High
2	Unmatched or ambiguous tickets are routed to the General Support Triage Queue.	Manual intervention is still required for tickets that cannot be classified automatically.	Medium
3	Classification and routing rules require maintenance when categories, terminology or support-team structures change.	Frequent business changes can increase administration and configuration effort.	Medium

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Workflow processes newly created Incident / Service Request tickets through Flow Designer.	Expand and optimize workflow conditions, branches and assignment rules to support higher ticket volumes and more support groups.
2	Data Storage	Ticket information and workflow/audit records are maintained within the ServiceNow platform.	Improve record management, archival/retention practices and audit-data organization as ticket history grows.
3	Performance	Automated classification and routing reduce manual triage time; documented average triage time is 1.2 seconds.	Optimize flow execution, reduce unnecessary actions and introduce asynchronous or event-driven processing where appropriate for larger workloads.
4	Security	Access is controlled through the ServiceNow platform and configured roles/permissions.	Apply least-privilege access, strengthen role-based controls, review audit logs and secure future integrations/API access.

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Expand classification rules and improve fallback/triage handling.	Near Term	Higher coverage for incoming ticket types and fewer manual classification cases.
Phase 2	Machine-learning-based semantic ticket classification.	Mid Term	Better handling of varied ticket wording and improved automated classification coverage.
Phase 3	Sentiment analysis and intelligent prioritization/escalation.	Mid to Long Term	Additional context for priority and escalation decisions.

Phase 4	Multi-language support and dynamic workload-based assignment.	Long Term	Broader usability and more adaptive routing across support teams.
---------	---	-----------	---

Note: The reference template organizes this document into three areas: current limitations, a four-part scalability plan (User Load, Data Storage, Performance and Security), and a four-phase future roadmap. The content above applies that same structure to the actual Auto Ticket Classification project.
